

MISSION ID: BP-AI-2026 // STATUS: DEPLOYMENT READY

# Bennett & Pless AI & Vibe Coding Event

From Concept to Code: Building the Future of AEC

## TECHNICAL SPECS:

DATE: FEB 4-5, 2026

LOCATION: ATLANTA, GA

FACILITATORS: RYAN DOBBINS & DAVE MILLER

# Why AI in AEC, Why Now?

## The Pressure

### Core Drivers

- **Margin Compression:** Increasing pressure on fixed-fee work.
- **Talent Constraints:** Industry-wide shortages & uneven experience levels.
- **Project Demands:** Faster schedules combined with higher QA/QC expectations.
- **Complexity:** Increased coordination complexity and risk.

## The Shift

## The Core Concept: Human-in-the-Loop

AI flags, prioritizes, and suggests. Engineers validate, decide, and stamp.  
AI reduces missed issues, not professional responsibility.

# The Build Team Roster

## Product Owner

### Name

Scott Steiding

### Role

Defines "Done," business acceptance criteria, and application needs.

## Architect

### Name

Kelvin Thom

### Role

Oversees security, compliance, and Tech Stack.

## Lead Developers

### Name

Doc Lunce,  
Caleb Johnson

### Role

Repository owners & Code integrity.

## Consultants

### Name

Ryan Dobbins,  
Dave Miller

### Role

Facilitation, Vibe Coding Guidance, Coding Guidance, Technical Strategy.

## Engineers/QA

### Name

Destiny Simmons,  
Lucky Lakhwinder,  
Prabin Gautam,  
Dante Hart

### Role

Building, Testing, & User Perspective.

# Warm Up: The 'Ah-Ha' Moment

Turn to your neighbor or share with the room...

**What was the specific moment when you realized  
AI would fundamentally change how you work?**

Timing: 30 seconds per person.

# Development Philosophy: Vibe Coding

**Blending AI speed with Engineering rigor.**

**Fast /  
Creative**

**Ideation / The Vibe**

**Replit Agent**

Creative Generation. "Show me a dashboard that looks like X".

**Engineering / The Logic**

**Cursor**

Refactoring & Safety. "Refactor this Supabase join".

**Source Control / The Truth**

**GitHub**

Version History & Collaboration.

**Infrastructure**

Next.js 14, Supabase (PostgreSQL), Tailwind CSS

**Stable  
/ Typed**

# The Development Cycle

# Mission Timeline

## Day 1 (Feb 4) - Contract Review Tool

## Day 2 (Feb 5) - IPO Tracker Tool

# Day 1 Focus: Advisory Contract Risk Review

## The Problem:

Professional services agreement reviews are time-consuming, inconsistent, and create delays.

## The Goal:

Accelerate manual review, improve documentation quality, and reduce risk exposure.

**CONSTRAINT:** AI is ADVISORY ONLY. It never marks an issue as 'resolved'. Human-in-the-loop is mandatory.

# Contract Review - Feature Requirements

**Clause Detection:** Identify & map clauses to the B&P Checklist.

**Red Flag Scanner:** Automatically detect 'Never Acceptable' terms (e.g., Liquidated Damages, Warranties)." (JetBrains Mono for data)

**Insurance Check:** Sync against internal data; flag 'Additional Insured on Professional Liability'." (JetBrains Mono for data)

**Output Generation:** Create single structured table (Clause Location | Verbatim Text | Acceptable Y/N)." (JetBrains Mono for data)

**Success Metric:**

Significantly reduce **60-minute** review time.

# Day 2 Focus: IPO Tracker

## The Problem:

Need a lightweight tracker independent of Acumatica to capture meaningful outreach details.

## The Goal:

Capture “Intelligent Proactive Outreach” (IPO) activity with zero friction.

## Scope:

- **Interface:** Chat-first (Create/Update via natural language).
- **Ownership:** Primary Owner model. Completion responsibility rests with the human.
- **Data:** Read-only lookup from Acumatica (Clients/Contacts).

# IPO Tracker - Architecture & Boundaries

AI suggests IPOs -> User confirms -> Manual promotion to Acumatica required.

# Pre-Flight Check: Environment Setup

## Accounts

- ☐ Replit Team (Org ID: wa9z69)
- ☐ GitHub Repo (vibe\_coding) - Write Access
- ☐ Supabase Project (BP AI Lab) - Developer Role
- ☐ Vercel Team - Member Role

## Local Toolbelt

- ☐ Cursor IDE (Installed + AI Active)
- ☐ Node.js (LTS)
- ☐ Git
- ☐ Python 3.11+

Connectivity: Confirm access to all domains via venue WiFi.

# Quick Triage & Troubleshooting

## Replit Stuck?

Refresh browser.  
Check VPN (WebSockets).

## Supabase 401 Error?

Check `.env.local` for  
SUPABASE\_ANON\_KEY. **Do NOT**  
use Service Role key.

## GitHub Permission Denied?

Use HTTPS clone URL, not SSH.

## AI Hallucinating?

Reset Context. Feed it the PRD  
or Schema again.

**Pro Tip:** When in doubt, restart the dev server: `npm run dev`

# Documentation & Resources

## Primary Channels

- **The Source of Truth:** `docs/impl/` folder in the Repository.
- **Cursor Rules:** `.cursor/rules` (Tech stack context, code style).
- **Support Channel:** Internal Bennett & Pless IT Teams Channel.

## Key Documents

-  01-it-setup-checklist.md
-  04-dev-flow.md
-  08-troubleshooting-guide.md

**Pro Tip:** Always check the repository for the latest versions of these documents.

# LET'S BUILD

1. Open Replit.
2. Check your invites.
3. Initialize the Prep Session.
